

### DLMS to MODBUS converter:

The protocol adopted by energy meters being standardized as DLMS, any AMR/AMI system that acquires data from meters will need to understand the protocol. In technical terms, the intermediate Data concentrator Unit (DCU) will require DLMS client.

For system integrators and monitoring solution developers, learning and implementing the DLMS client is a challenge.

**DL-DLMS gateway** is a simple DCU which can act as a DLMS client and provide you data over MODBUS. It is an intelligent device which pulls data from the meter at predefined intervals and provides the upstream system with meter data over **MODBUS**.
